

GUIDE v.36.2 importance scoring piecewise constant weighted least-squares regression tree for predicting FSLPR. Tree constructed with 13257 observations. Maximum number of split levels is 4 and minimum node sample size is 132. At each split, an observation goes to the left branch if and only if the condition is satisfied. Set $S_1 = \{1, 2, 9\}$. Sample size (*in italics*) and mean of FSLPR printed below nodes. Terminal nodes with means above and below value of 3.842E+05 at root node are colored yellow and skyblue, respectively. Second best split variable at root node is FULB.
